

Trigger point Dry Needling (TDN) Consent Form

Trigger Point Dry Needling involves placing a small needle into the muscle at the trigger point in order to cause the muscle to contract and then release, improving the flexibility of the muscle and therefore decreasing the symptoms.

TDN is a valuable treatment for the musculoskeletal pain. Like any treatment there are possible complications. While these complications are rare in occurrence, they are real and must be considered prior to giving consent to treatment.

Risk of the procedure:

Though unlikely there are risks associated with this treatment. The most serious risk associated with TDN is accidentally puncture of a lung (pneumothorax). If this were to occur, it may be likely only require a chest x-ray and no further treatment. The symptoms of shortness of breath may last several days to weeks. A more severe lung puncture can require hospitalization and re-inflation of the lung. This is rare complication and in skilled hands should not be a concern.

Other risks include bruising, infection, and nerve injury. Please notify your provider if you have any conditions that can be transferred by blood. Bruising is a common occurrence and should not be a concern unless you are taking a blood thinner. The needles are very small and do not have a cutting edge, the likelihood of any significant tissue trauma from TDN is un-likely:

Please consult with your practitioner if you have any questions regarding the above treatment.

Do you have any known diseases or infection that can be transmitted through bodily fluids?

Yes No

If you marked yes, please discuss with your practitioner.

Please print your name
